ITMS2014+ Open Data API — Cheat Sheet for povolbach.sk

Base URL: `https://opendata.itms2014.sk/v2/` **Format:** JSON (REST API) **Auth:** None required (public data) **Swagger spec:** `https://opendata.itms2014.sk/v2/swagger.json` ← START HERE with Claude Code

---

Endpoints We Need for V1

1. PROJECTS — The core data

Endpoint	What it gives us
`GET /projekty/vrealizacii`	All projects currently being implemented
`GET /projekty/vrealizacii/{id}`	Detail of a specific active project
`GET /projekty/ukoncene`	All completed projects
`GET /projekty/ukoncene/{id}`	Detail of a specific completed project

Key fields in project detail:

- `nazov` — Project name
- `popisProjektu` — Project description
- `prijimatel` → links to Subject (beneficiary = the municipality!)
- `sumaZazmluvnena` — Contracted amount (€)
- `sumaZazmlunenaPovodna` — Original contracted amount
- `miestaRealizacie` — Places of implementation (municipality/district)
- `stav` — Project status
- `datumZaciatkuRealizacie` / `datumKoncaRealzacie` — Start/end dates
- `oblastiIntervencie` — Intervention areas (infrastructure, education, etc.)
- `vyzva` → links to the Call (výzva)
- `kod` — Project code in ITMS
- `urlAdresaZmluva` — URL to published contract

2. SUBJECTS (Beneficiaries) — Who received the money

Endpoint	What it gives us
`GET /subjekty/{id}`	Detail of a subject (municipality, company, NGO, etc.)

Key fields:

- `nazov` — Name (e.g., "Mesto Košice", "Obec Podbiel")
- `ico` — Company ID (IČO) — unique identifier for each municipality
- `dic` — Tax ID
- `obec` → NUTS code (links municipality to geographic classification)
- `obec.gpsLat`, `obec.gpsLon` — GPS coordinates (for map!)
- `psc` — Postal code
- `ulica`, `ulicaCislo` — Address

Note: Subject IDs are obtained from project details (via `prijimatel` field), not from a standalone list endpoint.

3. CALLS (Výzvy) — What funding was available

Endpoint	What it gives us
`GET /vyzpilanovanee`	Planned calls
`GET /vyhlaseneVyzvy`	Published calls
`GET /vyhlaseneVyzvy/{id}`	Detail of a published call

4. GRANT APPLICATIONS — Who applied and what happened

Endpoint	What it gives us
`GET /zpijatonefp`	Received grant applications
`GET /zschvalenonfp`	Approved grant applications
`GET /zzamietnutonfp`	Rejected grant applications

Key fields in approved applications:

- `prijimatel` — The beneficiary
- `schvalenaSuma` — Approved amount
- `pozadovanaSuma` — Requested amount

5. PAYMENT REQUESTS — Actual money flow

Endpoint	What it gives us
`GET /predlozeneZop`	Submitted payment requests
`GET /uhradeneZop`	Paid payment requests
`GET /zamietnuteZop`	Rejected payment requests

6. IRREGULARITIES — Problems and fraud

Endpoint	What it gives us
`GET /nezrovnalost`	List of all irregularities
`GET /nezrovnalost/{id}`	Detail of an irregularity

Key fields:

- `celkovaSumaNezrovnalosti` — Total amount of irregularity
- `dlznik` — The debtor (who owes money back)
- `sumaNaVymahanie` — Amount to be recovered
- `vratenaSuma` — Amount already returned

7. PROGRAMME STRUCTURE — Understanding the hierarchy

Endpoint	What it gives us
`GET /operacneProgramy`	All operational programmes
`GET /operacneProgramy/{id}`	OP detail with financial allocation
`GET /prioritnaOs/{id}`	Priority axis detail
`GET /konkretnyCiel/{id}`	Specific objective detail
`GET /financnyPlan/{id}`	Financial plan for a priority axis

8. PUBLIC PROCUREMENT — How money was spent

Endpoint	What it gives us
`GET /verejneObstaravania`	All public procurements

Endpoint	What it gives us
`GET /verejneObstaravania/{id}`	Procurement detail
`GET /zmluvy`	Contracts from procurements

Pagination

All list endpoints support:

- `?minId={id}` — Get records with ID > minId (for pagination)
- `?limit={n}` — Return max n records
- `?modifiedSince={unix_timestamp}` — Only records modified since timestamp

Strategy: Loop with minId pagination. First call: no minId. Then use the max ID from results as minId for next call. Repeat until empty response.

Data Flow for povolbach.sk

```
Step 1: Pull all projects (ukoncene + vrealizacii)
        → Get project ID, name, amount, status, beneficiary ID, location

Step 2: For each project, resolve beneficiary (subjekt)
        → Get municipality name, IČO, GPS coordinates

Step 3: Match beneficiaries to municipalities
        → Use IČO to identify which are municipalities (vs companies, NGOs)
        → Slovak municipality IČOs are publicly known

Step 4: Aggregate per municipality
        → Total contracted amount
        → Number of projects (active + completed)
        → By theme/intervention area
        → Irregularities

Step 5: Normalize with population data
        → Pull from Slovak Statistical Office API
        → Calculate per-capita figures

Step 6: Build rankings
        → Total EU funds per capita
        → Number of projects per capita
```

```
→ Completion rate
→ Irregularity rate
```

Critical First Step

Before writing any code, fetch the Swagger spec:

```
https://opendata.itms2014.sk/v2/swagger.json
```

This gives you the machine-readable API definition. Feed it to Claude Code and it can generate the entire data client for you.

Other Data Sources to Combine Later

Source	URL	What it adds
Slovak Statistical Office	`https://slovak.statistics.sk` (DATAcube API)	Population, demographics per municipality
data.gov.sk	`https://data.gov.sk`	Municipal budgets, other open data
Ministry of Finance portal	`https://opendata.mfsr.sk`	Public spending per municipality
EU Cohesion Data Platform	`https://cohesiondata.ec.europa.eu`	EU-level comparison data
MuMAP (NKÚ SR)	`http://mumap.nkusr.sk`	Audit findings per municipality

What You DON'T Need from the 190-page Manual

- Pages 1-50: Admin setup, glossary, general descriptions → Skip
- Pages 50-180: Detailed field-by-field specs → Use Swagger instead
- Pages 180-190: Example JSON responses with dummy data → Useful for reference but Swagger is better
- The second manual (Manual_ITMS2014+) → Internal system admin, irrelevant for us
